

Justify your answers and show your work.

Evaluate each algebraic expression for the given value of the variable.

1. $4 - 5(5 + x)^2$, for $x = -7$.

Simplify the algebraic expression. Write all exponents as positive.

2. $7 - \frac{1}{2}[3 - (4 - 5)]$

3. $-(2x^5)^2$

4. $\frac{24x^2y^5}{32x^3y^{-9}}$

5. $\sqrt{8} + 3\sqrt{2}$

Perform the indicated operation and simplify.

6. $(4z^5 + 9z^4 + 17) - (-6z^4 + z^5 + 13)$

7. $(8x - 1)(x^3 + x^2 + x)$

Factor Completely.

8. $x^2 - x - 6$

9. $4x^3 - 4x^2 + 24x$

10. $x^2 - 64$

CAREFULLY copy your answers for each problem.
